The present sequence is a conjugate of a bacterial superantigen and an antibody mojety, and has been designed to target and destroy cancer cells. The bacterial superantigen is SEA/R-120 (see also ABP8455), which was derived from staphylococcal enterotoxin E (SEB) by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst maintaining production levels and biological activity: R206, N217, S246, R278, K318, K81E, K81S and D2275. SEA/E-120 was genetically fused to the FAD moiety of the tumour reactive antibody 574. Substitutions were made in the 574 sequence to obtain higher yields: in the heavy chain, H41P, 5446, 1677 and V1136, and in the light chain, F105, T45K, 1635, F73L, T775, 178V and L83A. An expression vector comprising DNA encoding the conjugate can be used to transform host cells for recombinant production cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLXNSDSFGGKVQRGLIVFHSSEGSTVS 420

The invention relates to an antibody in which 1 to 9 amino acids are replaced, deleted, inserted and/or added to substantially increase its catalytic esterase activity

The superantigen is derived from staphylococcal enterotoxin B (SEE) by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst maintaining production levels and biological activity: R20G, N21T, S24G, R27K, K79E, K81E, K83S and D227S. SBA/E-120 has been genetically fused to the Fab moiety of the tumour reactive antibody 5T4 to form a claimed conjugate (see ABP58454) designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          285

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is the protein sequence of engineered staphylococcal superantigen SBA/E-18. The superantigen is based on staphylococcal enterotoxin E (SEE, see ABPS8456) except for 4 amino acid residues close to the N-terminal that were from encerotoxin A and one substitution in the C-terminal part, D227A. Models of new superantigen variants were nonstructed using the SBA/E-18 model as the template. These include the new engineered superantigen SBA/E-120 (see ABPS8455), which has been genetically fused to the Fab moiety of the tumour reactive antibody 5T4 to form a conjugate (see ABPS8454) polypeptide. The conjugate is a claimed example of covel conjugates of the invention comprising an engineered bacterial superantigen and an antibody moiety. The conjugates are designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is a modified Staphylococcus enterotoxin SEB superantigen. The wild-
type SEE superantigen is modified to be used in a novel conjugate. The
novel conjugate comprises a target seeking moiety and a modified wild
cover to superantigen. This modified superantigen retains its ability to
activate a subset. Of T cells, even though I or more wild-type amino acid
residues in at least I region which functions in determining binding to T
cells receptor (TCR) and activation of a subset of T cells has/have been
replaced. Such a modified superantigen can optionally be used as part of
a conjugate with a target seeking moiety, for activating the immune
system to treat a mammalian disease. A pharmacoutical composition can be
prepared comprising a modified antibody (preferably a Pab fragment fused
to a peptide moiety providing activation of T cells in Wheta specific
manner) in which cysteines providing activation of T cells in Wheta specific
manner) in which cysteines providing activation of T cells in System eresidues) to
prohibit cysteine formation. The modified wild-type superantigen is used
continuum disease. The modified wild type superantigen has a lower
immunogenicity and reactivity with neutralising antibodies and has fewer
side-effects when used as a drug, compared to wild type superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conjugate of target seeking moiety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.
                                                                                                                                                                                                                   SEE; SEA; Staphylococcus enterotoxin; superantigen; conjugate; treatment; cancer; infection; autoimmune disease; antibody; modified.

The invention provides novel conjugates (see ABPS8454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABPS8455), which is based on SEE, and an antibody molety, such as tumour reactive antibody ST4. The superantigen is engineered to reduce seroreactivity whilst maintaining

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU1409) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus I (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 588-595 of gp41 from HIV-ILAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or absence of a test compound, in a reaction mixture containing DP107 and
biological activity and production levels. The conjugates are designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                            285
                                                                                                                                                                                                                                                                                                                                                                                                        345
                                                                                                                                                                                                                                                                                                                                                                                                                                                               120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     405

DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents a peptide sequence from Staphylococcus aureus enterotoxin type
                                                                                                                                                                                                                                                    285
                                                                                                                                                                                                                                                                                                                                                                                              405

CC 107x178x4 or PLZIP sequence search motifs, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, and Z comprises a carboxyl group, amido group, hydrophobic group, and service group, and fusion of the virus to the cell is inhibited. The peptides were cidentified by analysing the structure/motifs present in the HIV-1 glycoprotein 41 anti-HIV peptides DP107 and DP178. These heptad repeat contif containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic organisms and HIV isolates, looking for DP107/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to grotein from a pathogenic organism analyse proteins from a pathogenic organism analysed for regions analogous to DP107 or DP178

The invention relates to producing gene libraries, comprising immunoglobulin light and heavy variable region. The method involves selecting light chain that binds with the heavy chain product to produce a functional conformation, producing a gene library comprising a collection of these light chain variable genes, and combining with gene library of heavy thain variable genes. The method is used for production of gene and antibody libraries. The present sequence represents the amino acid sequence of a plasmid pFCAH9-E8d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                155
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   416

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         408
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

SEE superantigen can be modified to be used in a novel conjugate. The novel conjugate comprises a target seeking moiety and a modified wild novel conjugate comprises a target seeking moiety and a modified wild conjugate comprises a target seeking moiety and a modified wild cutivate a subset of T cells, even though lor more wild-type amino acid activate as ubset of T cells, even though lor more wild-type amino acid conjugate in at least l region which functions in determining binding to T cell receptor (TCR) and activation of a subset of T cells has/have been replaced. Such a modified superantigen can optionally be used as part of a conjugate with a target seeking moiety, for activating the immune conjugate with a target seeking moiety, for activating the immune a perpet to treaptor optionally be used as part of prepared comprising a modified antibody (preferably a Fab fragment fused to a peptide moiety providing activation of T cells in Vbeta specific to a peptide moiety providing activation of T cells in Vbeta specific confine antibody have been replaced (preferably by serine residues) to prohibit cysteine formation. The modified wild-type superantigen is used for treating cancer, viral infections, parasitic infestations and cautoimmune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer inmunogenicity and reactivity with neutralising antibodies and has fewer considered as a drug, compared to wild type superantigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 345

A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells. Disclosure; Page; 167pp; English. 31-MAY-2000; 2000US-0208128P WPI; 2003-361759/34. (TERM/) TERMAN D S. N-PSDB; ACA64698. US2002177551-A1. 28-NOV-2002, Terman DS;

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCS).

Also included are a mammalian cell useful in the treatment of cancer Also included are a mammalian cell useful in the treatment of cancer cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumouricidal immunocyte population in vivo in a mammal (by allowing tumour associated lipids to contact immunocytes in which creeptors for immunosuppressive fatty acids, ceramides, glycolipids, sphingolipids, glycosphingolipids, phosphosphingolipids, gangulosides, sphingolipids, glycosphingolipids, phosphosphingolipids, gangulosides, slalylated glycans, lipopeptides and proteoglycolipids are inactivated or superantigen (SAg) nucleotide inserted into a virus, a mammalian T cell useful in the treatment of cancer (where an adaptor protein which cuseful in the treatment of cancer (comprising a lipid raft conjugated to a superantigen), producing (M2) a tumouricidal immunocyte population ex vivo in a mammal (by cancer comprising a lipid raft conjugated to a superantigen) which receptors for the lipids are inactivated or deleted to produce tumouricidal immunocyte population, and administering the tumouricidally activated immunocytes to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the host), producing (M3) a tumouricidal part to the produced (M3) a tumouricidal part to the producing (M3) a tumouricidal pa

population ex vivo in a mammal (by allowing a tumour associated lipid to contact APCs, in which receptors for the tumour associated lipids are inactivated or deleted to produce a tumouricidally activated population, and administering APCs to the host), producing a tumouricidal T cell contact T cells, in which adaptor proteins, which inhibit T cell activation by tumour associated antigens, are deleted or functionally deactivated to produce a tumouricidal population of T cells, and activated to produce a tumouricidal population of T cells, and administering the tumouricidally activated T cells to the host, or allowing a superantigen-lipid raft to contact T cells ex vivo, and administering the tumouricidally activated T cells to the host), treating (MS) activated antiong molecule which confident in a mammal (by administering a lipid binding molecule which binds immunosuppressive tumour associated lipids in vivo), producing (MS) a tumouricidal T cell population in vivo in a mammal (by allowing a cumouricidal T cell population in vivo in a mammal (by allowing a cumouricidal T cell activated) and producing (M7) a cumouricidal T cell activated) and producing (M7) a cumouricidal T cell activated) and producing (M7) a cumouricidal T cell activation by tumour associated antigens are deleted or functionally deactivated) and producing (M7) a cumouricidal T cell activated) and producing (M7) a ceptors, methods and compositions are useful for treating cancers and cumours. Backerial superantigens are co-administered or administered as tumours bacterial superantigens are co-administered or administered as tumours proteins a bacterial superantigens or motife. The present staphined specification, but was obtained in celetronic format from the US patnet of the printed specification, but was obtained in celetronic format from the US patnet deleted was obtained in celetronic format from the US patnet because the present celetronic format from the US patnet deleted or producing to the printed sequence represents and compositions are ò 345 84 25 SEKSEEINEKDLRKKKSELQRNALSNLRQIYYYNEKAITENKESDDQFLENTLLFKGFFTG 226 SEKSEEINEKDIRKKSELOGTALGNIKQIYYYNSKAITSSEKSADQFLTNTLLFKGFFTG 286 HPWYNDLLVDLGSTAATSEYEGSSVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 85 HPWYNDLLVDLGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT BEKKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ ö 30.4%; Score 1072; DB 6; Length 248; 90.2%; Pred. The ScFv antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The ScFv antibody is also useful for treating inflammatory diseases. The ScFv antibody is also useful for treating diseases, cancers, central nervous system disorders including Parkinson's diseases, pariodontal diseases, cardiopulmonary diseases, cardiovaccular related diseases, and other immune disorders. The present sequence represents an Ig-5T4 fusion protein

This is the amino acid sequence of a single chain antibody (Sab), termed 5T4Sabl, comprising an scFv derived from murine monoclonal antibody 5T4 (Sae AAW8602) and the human gl constant region. CDNA (See AAW80291) encoding the Sab has been inserted into vector pCIneo to allow expression in mammalian cells. The trophoblast cell surface antigen defined by 5T4 tes expressed at high levels on the cells of a wide variety of human tumours. The invention relates to a vector comprising a nucleotide sequence coding for a tumour interacting protein (TIP) and optionally a nucleotide sequence of interest (NOI) which encodes a protein of interest (POI), the vector being capable of delivering the NOI and/or POI to the tumour recognised by the TIP. Delivery can be in vivo or ex vivo. The

The present sequence is the protein sequence of enterotoxin E (SEE) of Staphylococcus aureus. Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal pyrogenic ectoxins and staphylococcal exfoliative toxins (see ABB76234-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal exterioxins, with statistically significant sequence homology and similarity (Z value of Lipman and pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similar hydropathy profiles. These superantiqons are used to treat solid tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with one or more superantigens ex vivo to generate stimulated cells, selecting a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 YNDLLVDKGSKDATNKYKGKKVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEX 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SES) which may be used in the methods of the invention for treating cancer in a patient. These SES, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit trumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection.                                                                                                                                                                                                                                                                                                                                                                                                         SEE was isolated and purified from S.aureus. It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEE. Synthetic polypeptides having structural homology to Staphylococcal Excoxina are claimed, provided the homology includes statistically significant sequence homology, alignment of Gysteine residues and similar hydropathy profiles. See AAR13203-R13211
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody portifically binds to an antigen in a protein that binds to avointed in a protein that binds to avointegar in a protein that binds to avointegar in a protein that activates the phosphatidylinositol 3 (PI3K) signalling protein that activates the phosphatidylinositol 3 (PI3K) signalling or pathway. The bifunctional molecules are useful for gene therapy, for promoting Adenoviral (Ad) vector-mediated gene delivery to cells lacking avointegrins, for enhancing Ad binding and internalisation, and in gene delivery of by fibreless adenovirus particles. The bifunctional molecules permit targetting of viral and bacterial vectors to cells that express targetted receptors. Diseases that can be targetted include cancers, vascular disorders, bipperpoliferative disorders, and hormonal disorders. The present sequence is human N-terminal DAV-1 heavy chain-mature tumour necrosis factor-alpha (TNF-alpha) fusion protein which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, bifunctional molecule, monoclonal antibody, gene therapy, cancer, vascular disorder; diabetic retinopathy, restenosis, ophthalmic disorder; hyperproliferative disorder; hormonal disorder; DAV-1 heavy chain, cytostatic, vasctropic, ophthalmological, tumour necrosis factor-alpha, TNF-alpha, fusion protein.

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targeting agent. The alpha integrin, and the targeting agent is a protein that binds to alpha integrin, and the targeting agent specifically binds to a cell surface protein that activates the phosphatidylinositol-3-OH kinase (PI3K) signalling pathway. The bifunctional molecules are useful for targeted gene therapy using targeting delivery vectors, such as adenoviral gene delivery particles. The bifunctional molecules are useful for treating viral infections, rhematoid arthritis, cancers, cardiovascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperpolificative disorders, and hormonal disorders. The present sequence represents a fusion protein with mouse DAV-1 antibody heavy chain. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SELQCTALGNLKQIYYYNSKAITSSEKSADQFLTNTLLFKGFFTGHPWYNDLLVDLGSTA 300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                361 TIVPIDKVKISKKEV-----TVQELDLQARHYLHGK-FGL-YNSDSFGGKVQRGLIVF 411

This is the amino acid of the heavy chain of murine anti-human Fas monoclonal antibody HFE7A. CDNA (see AAV70129) encoding the heavy chain was obtained from HFE7A-secreting hypridoma (FERM BP-5828) RNA by RT-PCR (see AAV70125-26). The invention provides humanised HFE7A antibodies (see AAV3011-37) produced by CDR grafting. These antibodies are capable of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. They are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune continues of disease, including autoimmune continues by the statements of disease, including autoimmune carbonic attritis, autoimmune haemolytic anaemia, sterility, myssthemia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura and insulindependent diabetes), allergies, atopy, arteriosclerosis, myocarditis, autoimmune the anaemia, sterility, myocarditis, autoimmune haemolytic anaemia, sterility, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, ALDS and transplant rejection (all claimed). (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14;

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HPETA containing identical CDRs (complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, attriorisclerosis, mycoarditis, cardiomycopathy, glomerulonephritis, applastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. The present sequence represents the heavy chain of the murine analyment Fas monoclonal antibody HFETA, which is produced by hybridoma
                                                                                                                                                                             435

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents capoptosis in cells with a normal system, by inhibiting barvents and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, antiallergic, anti-architic, anti-inflammatory, antirheumatic, nephrorrological, immunosupressive, thyromimetic, antirheumatic, nephrorrological, immunosupressive, thyromimetic, antirheumatic, nephrorrological, immunosupressive, thyromimetic, antirheumatic, nephrorrological, immunosupressive, thyromimetic, antistensic cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, fashimoto disease, rheumatoid arthritis, graft versus host disease, soleroderma, Goodpasture syndrome, Crohn's clisease, autoimmune hemolytic anemia, sterility, myasthenia gravis, multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopethy, glomerulomephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively induce it in abnormal musical and murine Fas, so can be evaluated in marring disease, in heaven in the marring of the paperose in the minicipal collection of the marring electively induce it in manical murine fast of the minicipal collection of the marring electively induce it in minicipal collection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a preventive or treating agent for diseases caused by abnormality in Fas/Fas ligand system containing as the active component an antibody having as the light chain subunit a polypeptide containing residues 1-218 of one of 3, 239 residue amino acid sequences, or residues 1-451 of one of 3, 470 residue amino acid sequences, fully defined in the specification and having an activity of combining specifically with mammalian Fas and an activity of inducing apoptosis a cell expressing Fas. The agent has immunosuppressive and antiallergic activity and is used for preventing and treating autoimmune diseases, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NOKFKDKATLIVDKSSTTAYMELRSLTSEDSAVYYCARS-TMITNYVMDYWGQGTSVTVS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SAKTTPPSVYPLAPGSAAQTNSMVTLGCLVKGYFPEPVTVTWNSGSLSSGVHTFPAVLQS

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody specifically binds to an antigen in a protein that binds to avintegrin, and the targetting agent specifically binds to a cell surface protein that activates the phosphatidylinositol. 3 (PISK) signalling pathway. The bifunctional molecules are useful for gene therapy, for promorting Adenoviral (Ad) vector-mediated gene delivery to cells lacking av integrins, for enhancing Ad binding and internalisation, and in gene delivery of by fibreless adenovirus particles. The bifunctional molecules
                                                                                                                                                                                  645

permit targetting of viral and bacterial vectors to cells that express targetted receptors. Diseases that can be targetted include cancers, vascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence is human N-terminal DAV-1 heavy chain-mature stem cell factor (SCF) fusion protein which is used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CFLNNFYPKDINVKWKIDGSERQNGVLNSWTDQDSKDSTYSMSSTLTLTKDEYERHNSYT
